

Increased efficiency

CLOSER for self-closing SLIDING DOOR

■ What is a self-closing CLOSER?

Without using electric power, the door closes slowly and quietly after passing through. It increases the efficiency as it cuts out the need for closing. The door is also engineered to close slowly as to ensure safety.

【Spring system】

The door has a constantly loaded spring at its front and closes automatically by the spring's pulling force. The door ensures its safety as its bottom runs parallel to the floor.

【Speed controlled by air brake system】

It is possible to slow down further just before it becomes stationary using the air brake system.

■ Examples of use

We also receive orders for manufacture and installation of door main bodies, rails for sliding doors and rail covers.
